Human and Climate Impacts on Drought Dynamics and Vulnerability

Humdrought Project - Sheng project financed by Polish National Science Centre (contract 2018/30/Q/ST10/00654)

Institute of Geophysics Polish Academy of Sciences

This study examines changes in soil moisture and evaporative stress conditions for the period 1980-2020. The analysis is based on daily data derived from the model-based estimates of soil moisture and evapotranspiration -Global Land Evaporation Amsterdam Model (GLEAM).

The key scientific questions:

- Is a drying trend observed in the Vistula catchment?
- Which parts of the Vistula catchment are most significantly affected by the drying trend?
- How are changes in soil moisture manifested in a seasonal perspective?
