HYDRODYNAMICS OF A FISH-SHAPED RIGID BODY: VELOCITY-DRAG COUPLING

Miriam Castagna, Stuart Cameron, Beth Scott, Samuel Martin, Andrea Zampiron, Vladimir Nikora

This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No. 860800

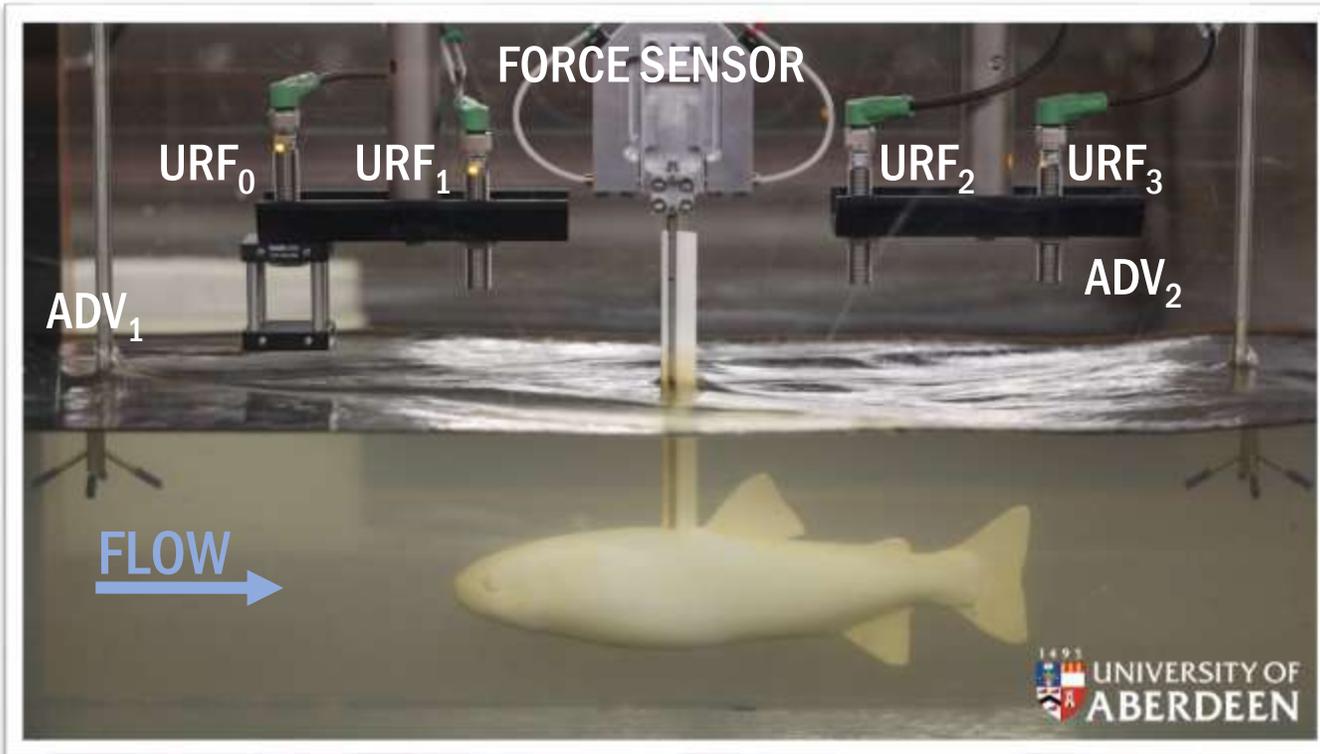

SMALL HYDROPOWER PLANT WITH FISHWAY

EXISTING FISHWAYS ARE SELDOM EFFECTIVE BECAUSE:

- Poor attraction efficiency
- Optimum flow conditions for target fish species within the fishway are not known
- Fish-flow interactions are not yet well understood

LABORATORY EXPERIMENTS

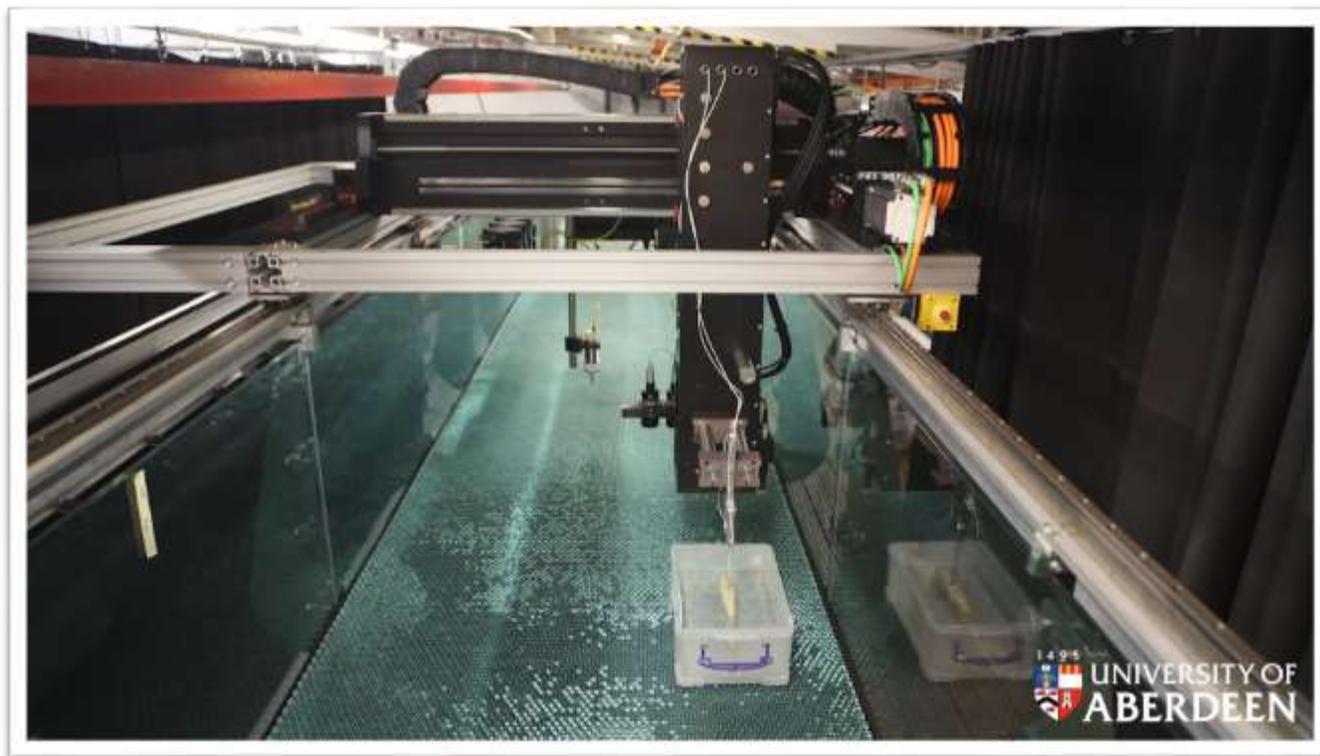

RUN	Q ($\text{m}^3 \text{s}^{-1}$)	U (m s^{-1})	H (mm)	L (mm)
"U4-L5"	0.0358	0.660	180	270

- Q is flowrate
- U is cross-sectional average velocity
- H is water depth
- L is fish model body length

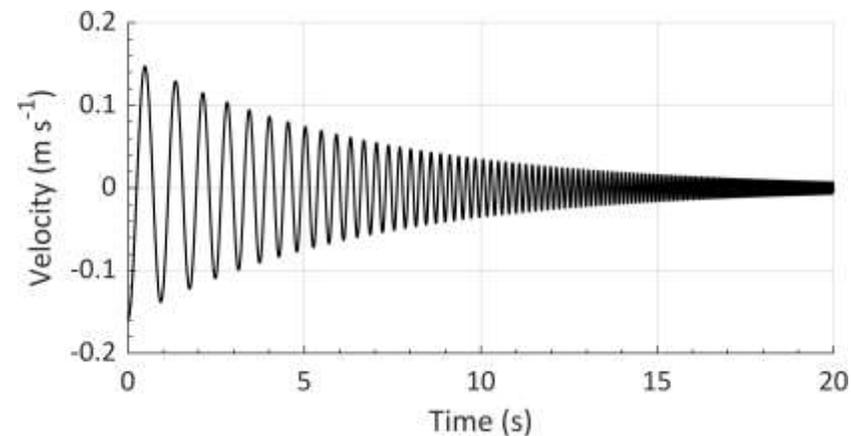

ADV = Acoustic Doppler Velocimeter

URF = Ultrasonic Range Finder

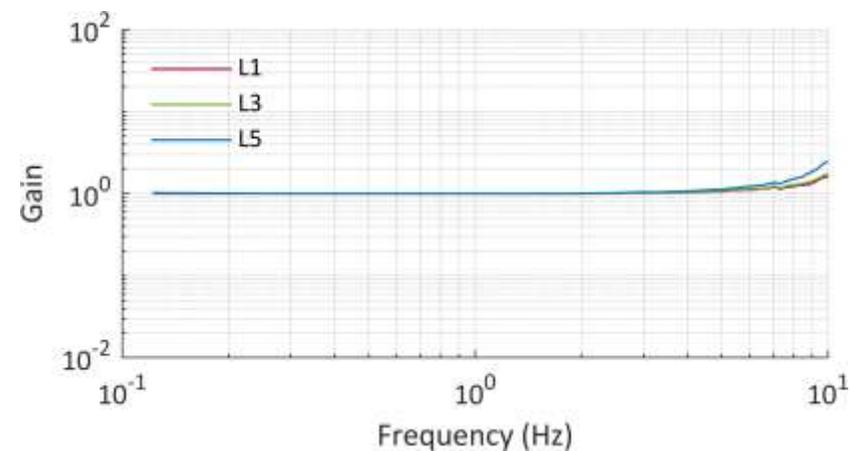

DRAG DEVICE FREQUENCY RESPONSE

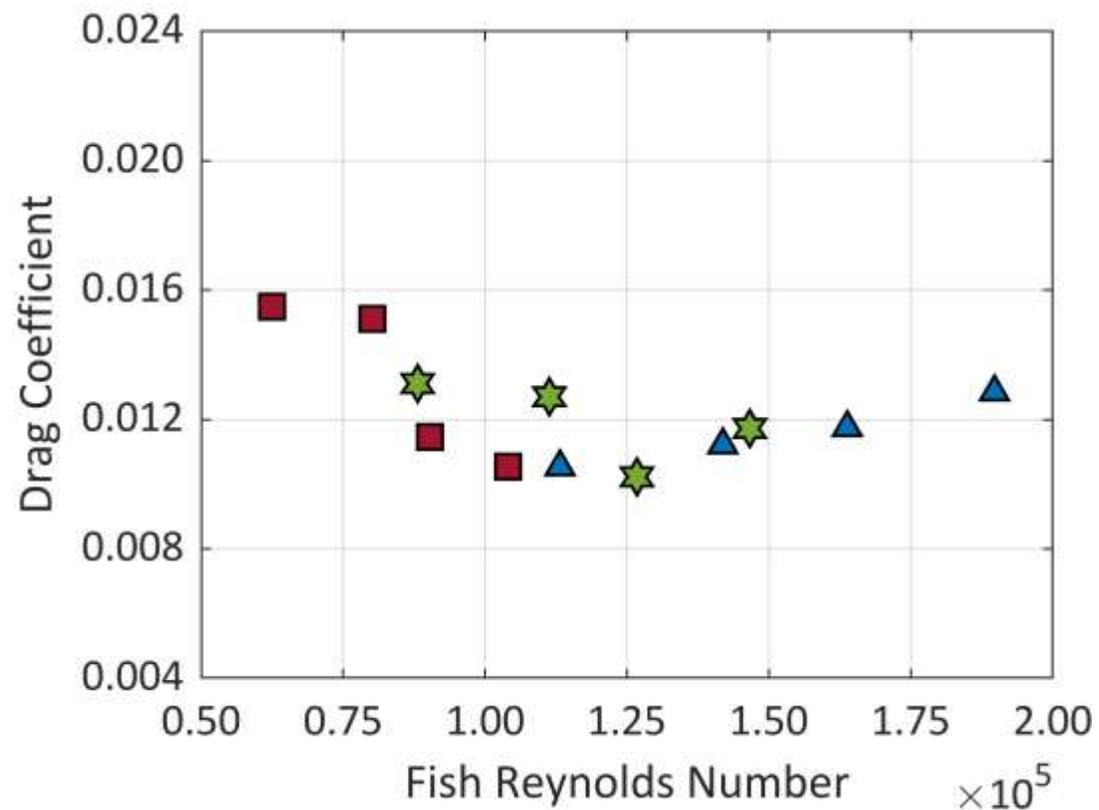

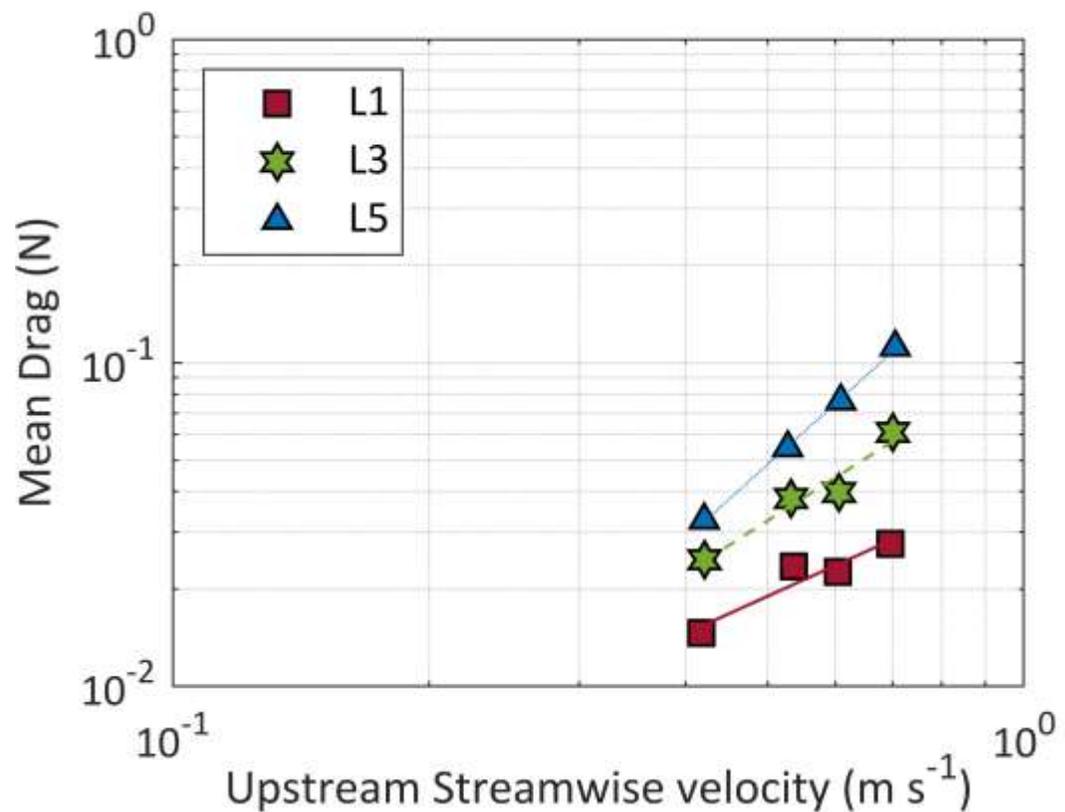

SINE SWEEP FUNCTION

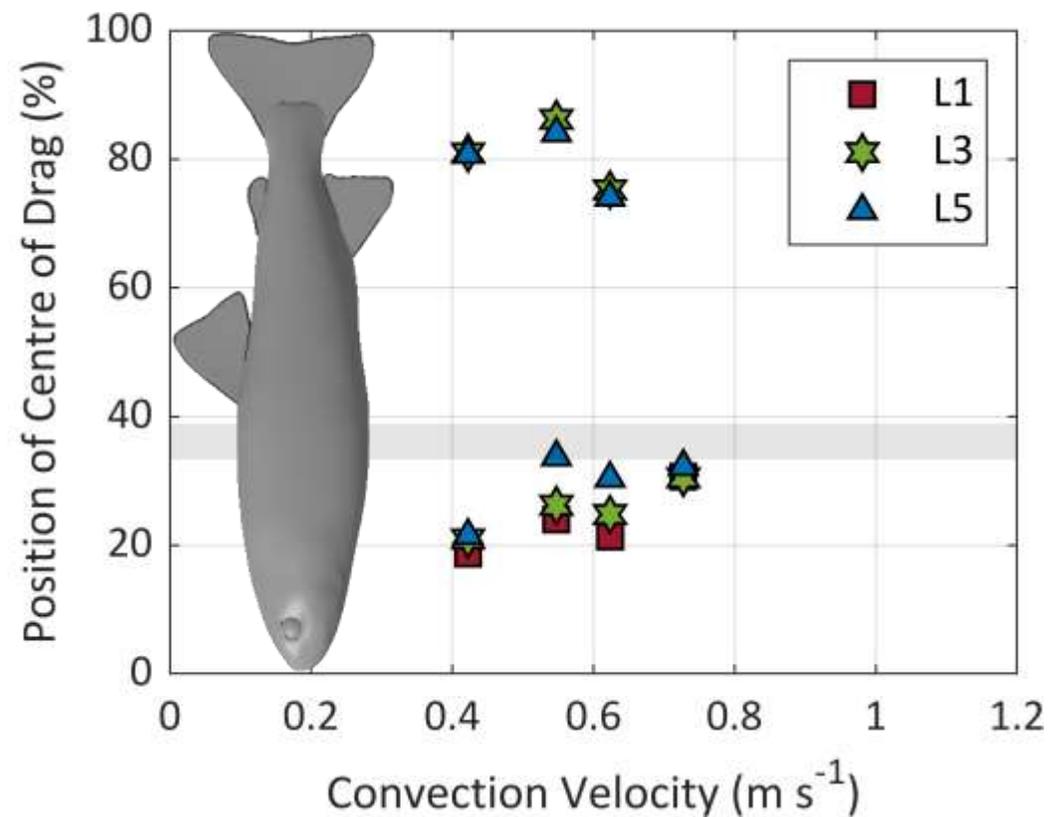

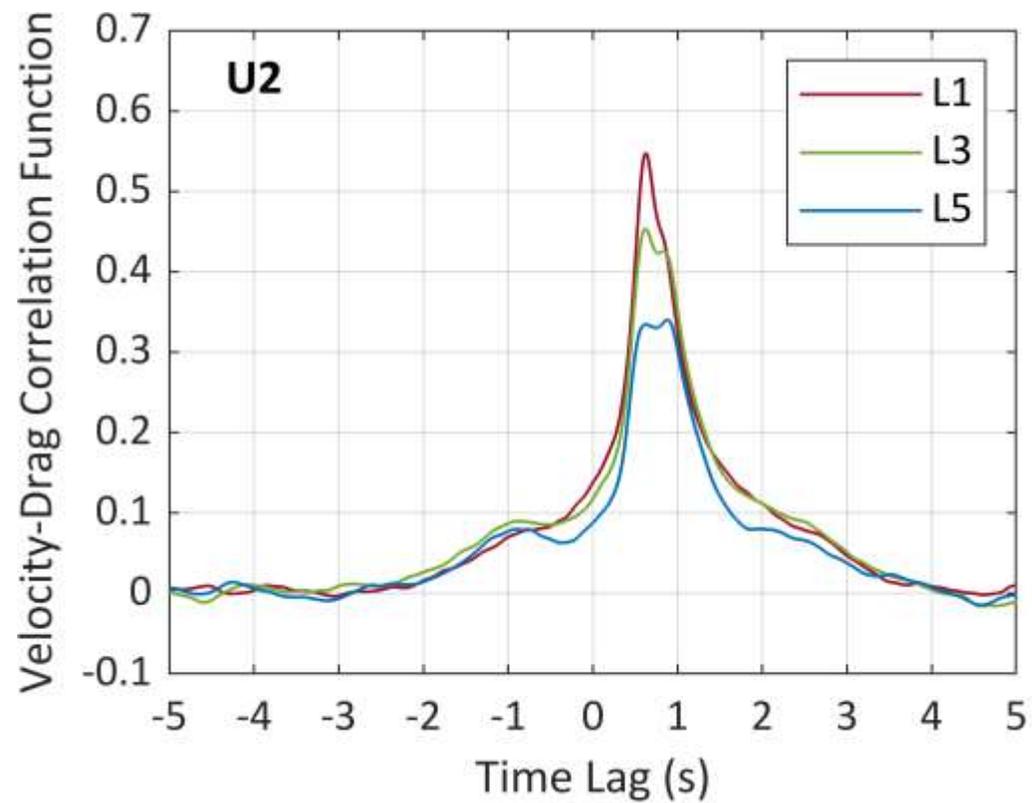

MAGNITUDE OF THE FREQUENCY RESPONSE FUNCTION

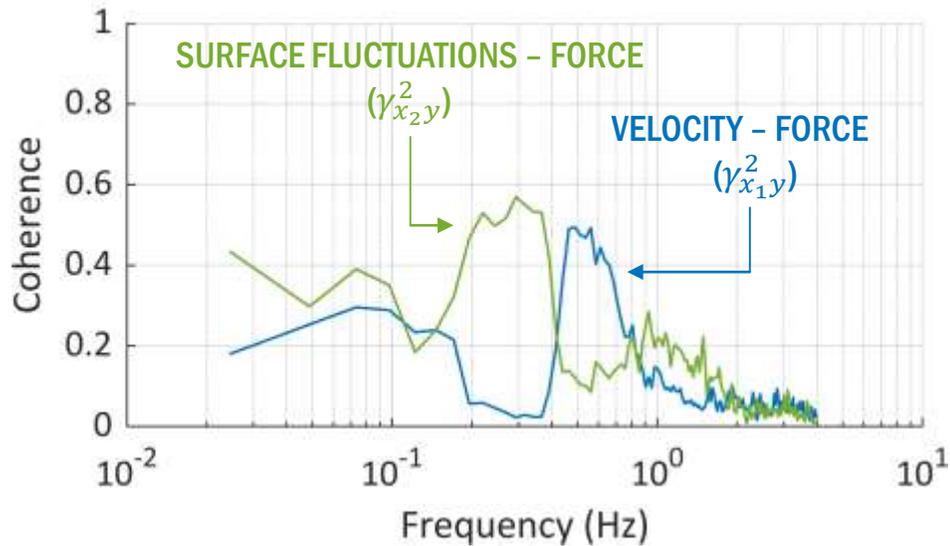

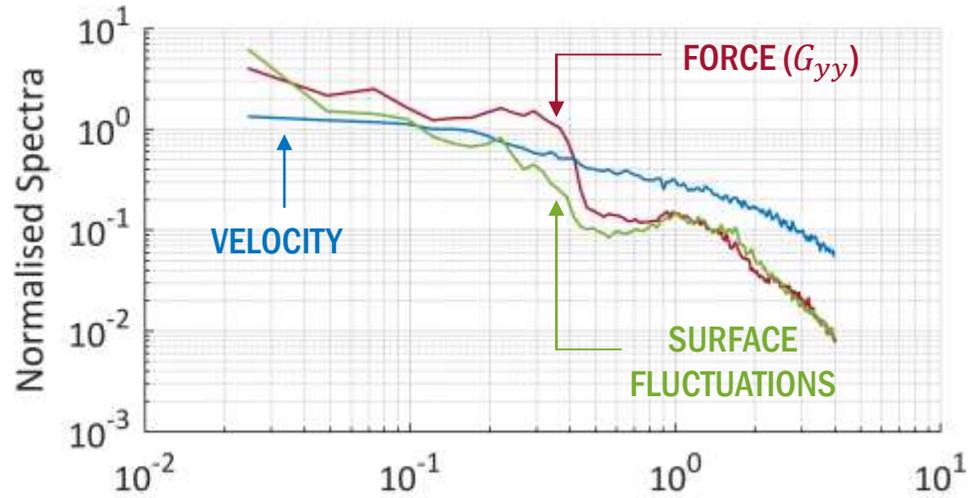

MEAN DRAG

DRAG FORCE GENERATION MECHANISMS

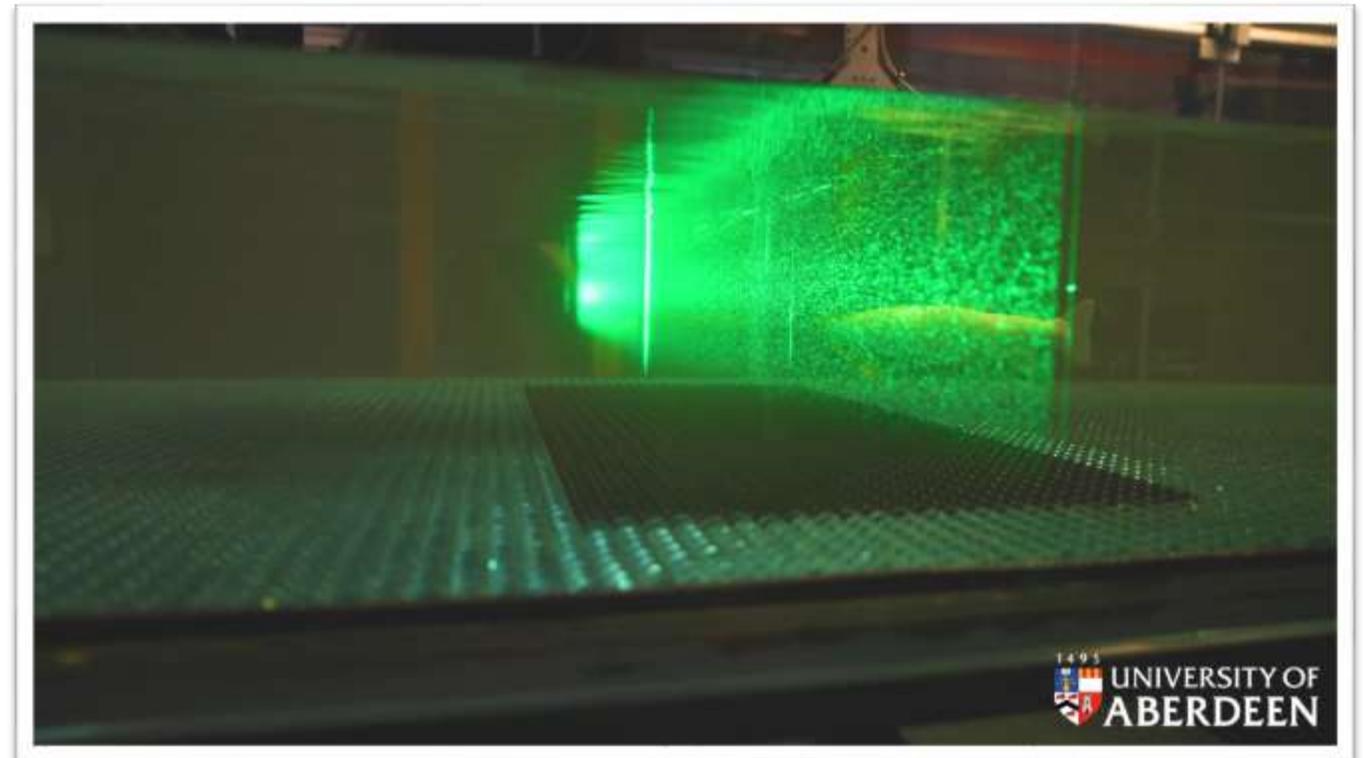

TWO-INPUT LINEAR MODEL:

$$\text{Force variance} = \underbrace{\int_0^{5 \text{ Hz}} \gamma_{x_1y}^2 G_{yy} df}_{15\%} + \underbrace{\int_0^{5 \text{ Hz}} \gamma_{x_2y}^2 G_{yy} df}_{35\%} + \underbrace{\text{Residual}}_{50\%}$$

NEXT STEPS

Particle Image Velocimetry “PIV” experiments to clarify:

- Origin of the two peaks in the correlation function
- Three dimensional wake structure
- Optimum configuration for the momentum integral method

This project has received funding from the European Union's Horizon 2020 research and innovation programme under the Marie Skłodowska-Curie grant agreement No. 860800
